出版时间:2006-05-01

装帧:Paperback

isbn:9780596101794

This book covers everything you need to know to build browser-based applications. The emphasis is on using XML, Document Object Model (DOM) and XSLT for processing, and a variety of presentation methods including XMLHTTP (Ajax), XHTML, XForms, CSS, RSS, and Atom. Following the core of REST (representational state transfer) model of web services, advanced material in the book focuses on server side programming and the various ways of processing and serving requests for XML data. There are also helpful hints for which server-side applications best support client-side processing approaches.
