This book teaches everything a Java developer needs to know to start building Ajax applications on Java -- without any lecturing or hype. With plenty of hands-on labs developers will soon be up and running with the tools needed to build efficient and

responsive web applications. Instruction is also provided on setting up a development environment, connecting a database, and choosing between the popular Ajax libraries and toolkits including Prototype, Scriptaculous, Dojo, and DWR. Later chapters cover projects that are more complex, including integration with Java Server Faces, Struts, Tapestry.
