BizTalk Server 2000 is part of the .NET family of Enterprise Servers designed to work together to provide e-business solutions. The .NET Enterprise Servers are based on open Web standards, such as XML, to allow an organization to integrate and orchestrate their applications and service needs into a single comprehensive solution.

This book shows how to use BizTalk Server 2000 to create, integrate, manage, and automate business processes for the exchange of business documents.
