For courses in advanced electromagnetics at the senior to graduate level. Assumes a first course background in electromagnetics. This intermediate text emphasizes concepts, examples, and problem-solving techniques having wide applicability, and relies only on basic physics and mathematics - rather than electrostatics, magnetostatics, and quasistatics. The focus is on generic problem-solving techniques - both mathematical and physically-intuitive, and the presentation of basic electromagnetic theorems - Poynting, energy, uniqueness, and reciprocity - explained from a physical perspective.
