isbn:9780826482945

"Language Engineering" examines the processes involved in dictionary-making using computational linguistics, including tagging, parsing, spell-checking, lexical semantics and machine translation. The book examines dictionary-building in English, but also includes appendices applying natural language processing to French and German. This book is the first detailed description of syntax and semantics using the C(C++) programming language, and as such should be essential reading for researchers in natural language processing and computational linguistics.
