Trees are the most important, most expensive, and ideally the most permanent plants in a home landscape. Because planting the wrong tree in the wrong place can create serious problems, selecting the right tree is the most important choice a gardener can make. This definitive, handy reference for gardeners, homeowners, and horticultural professionals features * 200 genera and 350 species of shade trees, ornamentals, and conifers, both deciduous and evergreen * The best selections for spring bloom, fall color, showy fruit, ornamental bark, and disease resistance * Trees that will thrive in the hottest and coldest regions of North America * Full-color identification photos to take with you to the nursery * Illustrated instructions on proper pruning, planting, and growing techniques.
