There are many well-established scientific reasons that the HIV/AIDS hypothesis is highly doubtful. In *Science Sold Out*, Rebecca Culshaw describes her slow uncovering of these reasons over her years researching HIV for her work constructing mathematical models of its interaction with the immune system. It is rare that a researcher who has received funding to study HIV ever expresses any doubt in the paradigm, and an even rarer event still when she abandons the field altogether. This book focuses on the changing definition of AIDS and the flaws in all HIV testing. In a much broader sense, it explains how the current, government-based structure of scientific research has corrupted science as the search for truth. It offers not only scientific reasons for HIV/AIDS being untenable, but also sociological explanations as to how the theory was accepted by the media and the world so quickly. In particular, this book offers a scathing criticism of the outrageous discriminatory measures that have been leveled at HIV-positives from the inception.
