Over the last decade epidemiological studies have suggested that the risk of coronary

heart disease, stroke mortality and hypertension is, in part, related to the environment encountered during fetal life. In particular, maternal undernutrition during pregnancy has been highlighted as a causal factor in the long-term programming of disease risk. This book, which brings together the perspectives of leading researchers from Europe, the USA and Australasia, provides the reader with a detailed account of the evidence for and against the nutritional programming of human disease, and considers the biological basis of programming. The book addresses a topic of great current interest and controversy.
