In Hematologic Malignancies: Methods and Techniques, a panel of acknowledged experts review many of the key molecular methods used for the diagnosis and subsequent management of hematologic malignancies. These clinically relevant techniques range from routine test procedures to highly sophisticated methods currently offered only by specialized reference laboratories, and fall into five major groups: cytogenetics, polymerase chain reaction, flow cytometry, cytochemistry and immunochemistry, and apoptosis and cytokine receptors. Serving both clinical and experimental needs, Hematologic Malignancies: Methods and Techniques provides an array of powerful tools that will guide clinicians- especially hematologists, oncologists, and pathologists-to better diagnose and manage their patients with hematologic malignancies, and enable researchers to assess the anticancer effect of agents that impact cancer cells at the molecular level.
