This monograph analyzes most of the new data available regarding the pathogenesis and development of Type 1 and Type 2 diabetes. It presents novel treatments to prevent the disease, and discusses the role of glucose, lipoproteins, and other metabolic and cardiovascular risk factors in diabetes morbidity. The book covers recent advances in major clinical areas, offering the latest in therapeutic developments and diabetic complications. The volume comprises 31 chapters authored by the foremost international authorities. Not a systematic textbook, it instead focuses on "hot topics" in diabetes that will aid the transfer of recent research achievements into improved diagnosis and clinical practice.
