Industrialization, urbanization, agriculture, and resource exploitation are activities associated with a developing society. "Geoenvironmental Sustainability" focuses on such a society's geoenvironment and the natural capital that defines it. The book explains these elements in systematic detail, particularly with respect to their relationship to five thematic areas known as WEHAB: water and sanitation, energy, health, agriculture, and biodiversity - all factors identified as key areas of concern by the 2002 Johannesburg World Summit on Sustainable Development (WSSD). This significant reference addresses topics that include: land environment sustainability pertaining to its interaction with the impacts generated by industrial and urbanization activities - in particular with various waste discharges; the magnitude of the problem of urbanization and industries; nonrenewable natural resources, typical case histories, and examples of sustainability actions; and the geoenvironmental perspective of the present status of where we are in the geoenvironmental sustainability framework, with a view that points toward where we need to go. Providing a geoenvironmental perspective on the sustainability of the environment, "Geoenvironmental Sustainability" is an essential resource for those who are poised to meet the challenge of mitigating manmade threats associated with development.
