IBM has moved 15,000 desktops to Linux, and they intend to move all 300,000 desktops to Linux by the end of 2005. Novell will move its 6,000 desktops to Linux by the end of 2004. They clearly understood something that businesses and governments across the

world are coming to know: that Linux desktops are cheaper, more reliable, and easier to maintain than Windows systems. And now that Linux is file-format compatible with Windows, switching is feasible for organizations large and small. This book is truly unique. It covers key Linux business desktop technologies, including Linux Thin Clients and integrating Linux desktop email clients with Microsoft Exchange Mail Servers. It provides information that network admins new to Linux need to understand before diving in to large desktop deployments. Core desktop Linux technologies covered include: the Linux Terminal Server Project (LTSP), kiosk-mode desktops, and transactional systems. The book continues with explanations of office automation software on Linux. The case studies make it all "REAL" by showing HOW businesses and government organizations have successfully made the transition to Linux desktops.
