isbn:9780521781282

Already wireless tags are being used for everything from access cards to security tags on clothing, but the continually falling cost of these devices is about to herald a new revolution as RF tags look set to replace bar codes on everything from food products to books. This book discusses the technology behind these tags, covering the RF design, fabrication techniques and communications principles behind these remarkable devices. Ideal for students or practising engineers, it also includes much information of value to technology strategists and managers.
