isbn:9783540262497

This book deals with environmental and human risk problems caused by contamination from the perspective of real world applications with quantitative procedures. It includes risk methods for the discussion of environmental problems where data are sparse or fuzzy, as well as incorporating political, social and economic considerations in determining directions of remediation solutions for environmental contaminant problems. Furthermore, it highlights the impact of contaminants on human health, in some cases ultimately leading to death, as well as the anthropogenic exacerbation of natural processes.
