著者:Raeburn, Paul

出版者:National Geographic Books

出版时间:2000-4

装帧:平装

isbn:9780792276142

Unimaginably distant, and yet at the same time the most Earthlike of the planets, Mars has exerted a powerful pull on the human imagination for thousands of years. It mesmerized the millions who watched as the small robot known as Sojourner explored its faraway surface from July to September 1997. Now, with a definitive book on this compelling subject, National Geographic presents a state-of-the-art report on the planet itself, the technology that allows us to explore it, and the prospects for further exciting discoveries. Highlighted by an astonishing collection of more than 125 full-color photographs, "Mars" includes a stunning, 3-dimensional, 8-page panoramic gatefold with images that capture the genuine wonder of discovery at the Pathfinder landing site.
