"This is a time of enormous change in the life sciences, and today's students need to appreciate science as an ongoing process. Using colorful and interesting examples ranging from medicine and cell biology to evolution and ecology, this book gives the reader a real feel for the dynamic process of science and conveys a clear sense of how discoveries are made. Together with its treatment of important ethical issues, this well written book will make a major contribution to teaching introductory biology." --
Geoffrey M. Cooper, Professor of Biology and Chair, Department of Biology, Boston University
