Global temperatures have increased since 1880. New data show that solar impacts (radiation and magnetic flux) have increased by the same amount and follow the dips in temperature from 1938 to 1970. The report from the Intergovernmental Panel on Climate Change (IPCC) says that, based upon computer models, increased solar absorption by CO2 and other "greenhouse gases" (GHG) are overwhelmingly the basis for temperature increases. But increases in global temperatures
