For more than 20 of the most important occupational toxicants, the documentations

for the established BAT values (Biological Exposure Values) and EKA values (Exposure Equivalents for Carcinogenic Substances) are provided. These include an authoritative review of the available toxicological studies and data. For every substance, metabolism and pharmacokinetics, critical toxicity, exposure and effects, suitable indicators of internal exposure, the evaluation of the BAT value and the correct interpretation of data are described. Basic physico-chemical data are provided as well. The documentations are thus not only essential for the application of BAT and EKA values but provide a concise overview of biological monitoring for each substance. The documentations are authoritative, because they were compiled by the Commission for the Investigation of Health Hazards of Chemical Compounds in the Work Area. The Commission is internationally acknowledged for its neutrality and is working strictly according to transparent, scientific criteria. BAT Values set the standards for legal regulations in many countries of the world, e. g. they are the basis for at least 30 % of the threshold limits valid in the European Union.
