isbn:9781933762067

This text presents casing design and mechanics in a concise, two-part format. The first part focuses on basic casing design and instructs engineers and engineering students how to design a safe casing string. The second part covers more advanced material and special problems in casing design in a user-friendly format. In an explanation of the origin of casing design, applications and limitations of the methods and formulas are presented, giving readers an understanding of how to use these tools in their own jobs -- and when NOT to use them. The book also provides a consistent and systematic foundation from which to understand literature and software applying to casing design and oilfield tubulars.
