Formal methods is the term used to describe the specification and verification of

software and software systems using mathematical logic. Various methodologies have been developed and incorporated into software tools. An important subclass is distributed systems. There are many books that look at particular methodologies for such systems, e.g. CSP, process algebra. This book offers a more balanced introduction for graduate students that describes the various approaches, their strengths and weaknesses, and when they are best used. Milner's CCS and its operational semantics are introduced, together with notions of behavioural equivalence based on bisimulation techniques and with variants of Hennessy-Milner modal logics. Later in the book, the presented theories are extended to take timing issues into account. The book has arisen from various courses taught in Iceland and Denmark and is designed to give students a broad introduction to the area, with exercises throughout.

## 书评

这本书，我用于研究生低年级，基本上看懂没问题。前半：CCS+HML部份讲解清晰，实例详尽。后半，讲Real Time CCS，估计是作者自己的研究兴趣部份，我直接放过。这样的本科教材，难得啊！
