isbn:9780120884032

This book provides an in-depth insight and overview of a number of most promising immunopotentiators in modern vaccines. In contrast to existing books on the subject, it provides recent data on the critical mechanisms governing the activity of vaccine

adjuvants and delivery systems. Knowledge of immunological pathways and scenarios of the cells and molecules involved is described and depicted in comprehensive illustrations. It includes contributions from leading international authorities in the field. It contains well-illustrated, informative figures that present the interactions between immunopotentiators and the host immune system, and each chapter lists advantages and potential hurdles for achieving a practical application for the specific immunopentiator.
