装帧:HRD

isbn:9780470092095

This title takes an interdisciplinary approach to the central role of solubility in pathological biom mineralisation, ranging from traditional thermodynamics and kinetics to unusual concepts such as the PILP process. The scientific background and expertise

of the contributors, ranges accordingly from solubility modelling and database development, renal stone and bone implant research, Mossbauer spectroscopy and structural chemistry to biochemistry and crystallisation. The chapters all have a quantitative, physico-chemical component rather than giving purely phenomenological descriptions. The contributors deal with aspects and concepts that have not previously been common in the study of pathological biomineralisation processes.
