出版者:Wiley

出版时间:2007-12

装帧:HRD

isbn:9780470029008

It provides a detailed, practical guide to building multi-agent systems using Jason, one of the most prominent agent programming languages and platforms. The book contains brief introductions to multi-agent systems and the Belief-Desire-Intention agent architecture (on which AgentSpeak is based), before explaining Jason's variant of the AgentSpeak Language. It then covers more detailed material aimed at advanced software development as well as some theoretical material of interest to researchers. The book also provides learning material including numerous examples and exercises, so it is a valuable teaching resource.
