Although its role in construction is being challenged by new composite materials and high-strength concrete, steel is still used to refurbish and retrofit historical buildings as well as new structures. It can effectively be combined with a variety of materials to obtain structures that are characterized by a high-performance response under different types of static and dynamic activity. Divided into five sections, with contributions from international experts, this book covers: calculation models and methods; studies and advances in design codes; steel and mixed building technology; steel under exceptional actions; and, steel in remarkable constructions and refurbishment.
