isbn:9781402736056

It all begins with the “Big Bang” billions of years ago and continues through to the recent landing on Mars. Filled with magnificent images and illustrated renditions of the universe’s most significant highlights, this natural history timeline soars through galaxies, nebulae, and solar systems, and tracks human exploration in the starry skies. Follow Earth and the other planets as they cool; the appearance of “modern humans” in Africa; and the creation of technology, from telescopes to satellites, that allows us to see and travel into outer space. Introductory pages—written by two experts who have worked for major planetariums and science museums—help shed insight on each section, and copious sidebars answer some of the most fascinating questions about a variety of phenomena.
