Indus Ethnobiology: New Perspectives From the Field is a unique and fascinating collection of interdisciplinary essays that study the Indus or Harappan Civilization of South Asia, one of the earliest urban civilizations. The essays in this volume utilize an ethnobiological approach to offer fresh insights into the sociocultural adaptations of the Indus people, as well as into urbanism and ecological and cultural change. Each article, written by a prominent scholar working in the region, studies animal and plant remains in order to explore issues such as environment, vegetation history, habitat exploitation, pastoralism, subsistence systems and agriculture. Incorporating biological, anthropological, and archeological theory, Indus Ethnobiology exemplifies what ethnobiology is and ought to be: a powerful source of ideas about the interrelationships between living organisms and human culture.
