The Tuner car is the new Hot Rod: a smaller, sleeker later model, geared to go faster than the next car. And, as always, when going for a pumped-up performance and style it's often critical - and difficult - to do it on a budget. That's where this book comes in.

"How To Build a Hot Tuner Car" author Scott Smith tells you about how to build a tuner car correctly, and how to do it without going broke. Beginning with the budget - what can you afford to spend? - Smith offers clear and helpful guidance on finding a good project car, planning it's transformation, and making it into the Tuner car of your dreams. Every step of the way, he points readers towards great deals - from junkyard swaps and aftermarket bargains to low-cost solutions to building challenges. Exterior, interior, suspension, wheels, engine, driveline - it's all here, from getting the parts to installing them properly, and shows that with inexpensive parts and a little innovation the end result can still be eye-popping attractive and top of the performance league!
