出版时间:2006-9

装帧:Pap

isbn:9780306815065

After more than two decades of research, the United States is on the verge of deploying a new generation of weapons that discharge light-wave energy, the same spectrum of energy found in your microwave, or in your TV remote control. It's called directed energy--lasers, high-powered microwaves, and particle beams. And it's a revolution in weaponry, perhaps, more profound than the atomic bomb. The E-Bomb author Doug Beason, a leading expert in directed-energy research, describes in clear and jargon-free prose all of these exotic new weapons. As the Los Alamos Monitor said, "Beason has a special vantage for peering over the horizon and relating what the twenty-first century holds in store." "[The E-Bomb] will appeal to readers schooled in Tom Clancy." (Kirkus)
