Although nanotechnology deals with the very small - the art and science of manipulating and rearranging molecules to create useful materials, devices and

systems - its impact on business will be revolutionary. Within a decade, nanotech is expected be the basis of \$1 trillion worth of products in the USA alone and will create anywhere from 800,000 to 2 million jobs. This groundbreaking book provides the savvy investor with: the steps they must take to assess and profit from the nanotech market; relevant information on more than 100 leading nanotech companies - and how to distinguish the real players from the "nano-pretenders"; and a comprehensive methodology for investing in - and profiting from - nanotech in a way that yields market-beating returns while minimising risk. With "Investing in Nanotechnology", investors everywhere can learn how to cash in on this next big thing.
