《Microsoft Office SharePoint Server 2007索引及搜索引擎内幕》主要内容：Tools and techniques for building custom search solutions in an enterprise environment. Optimize the user search experience in your workplace by customizing and extending the enterprise search capabilities in Share Point Server 2007. Two recognized Share Point experts deliver the straightforward guidance and pragmatic code samples you

need to enable quick access to critical information.

Discover how to:

Configure and manage the Share Point Server 2007 index file and search engines

Plan a search deployment strategy that balances performance, scalability, and security considerations

Set up and customize search functionality and UI controls

Monitor and analyze search-usage metrics to optimize the end-user experience

Use search APIs to prepare and execute queries and process the results

Program administrative functions using the search administration object model

Develop and install custom IFilters and protocol handlers

Use the Business Data Catalog to structure and index critical line of business data

Program search operations using Windows Share Point Services 3.0.
