Albertosaurus was a large carrion-eating dinosaur. The huge Albertosaurus walked in a side-to-side fashion and moved very slowly. It was difficult for Albertosaurus to hunt prey. This is why it feasted on the remains of other hunters kills. Albertosaurus had a large head and powerful jaws like its relative Tyrannosaurus Rex. But Albertosaurus had more teeth than Tyrannosaurus Rex. Albertosaurus grew to 26 feet in length and weighed up to two tons. Albertosaurus got its name because its first fossil was found in Alberta, Canada. Other Albertosaurus fossils have been found in the western United States and Mongolia. Albertosaurus's arms were so tiny that the giant dinosaur probably never used them at all.
