Physical Geology uses the scientific method to explain natural aspects of the earth--for example, how mountains form or why oil resources are concentrated in some rocks and not in others. This chapter briefly explains how and why the earth's surface and its interior are constantly changing. It relates this constant change to the major geological topics of interaction of the atmosphere, water and rock, the modern theory of plate tectonics and geological time. These concepts form a framework for the rest of the book. Understanding the "big picture" presented here will aid you in comprehending the chapters that follow.
