This chapter begins the detailed study of textiles and the properties they contribute to fabrics, apparel, furnishing, and industrial textiles. A good starting place is the definitions of the component parts of a textile fabric.

Fiber Any substance, natural or man-made,

with a high length-to-width ratio and
with suitable characteristics for
being processed into a fabric.

Yarn An assemblage of fibers, twisted or
laid together so as to form a contin-
uous strand that can be made into a
textile fabric.

Fabric A planar substance constructed from
solutions, fibers, yarns, fabrics, or
any combination of these.

Finish Any process used to convert gray
goods (unfinished fabric) into finished
fabric.
