The Social Sciences and Rationality brings together prominent scholars working in several social science disciplines and the philosophy of science to debate the promise and problems of rational choice theory. In its simplest form, the theory postulates that humans are purposive beings who pursue their goals in a rational, efficient manner, seeking the greatest benefit at the lowest cost. In the introduction and conclusion, the editors survey the current state of the debate and show how open, constructive dialogue enables us to move beyond hackneyed accusations and dismissals that have characterized much previous debate.
