This is a self-paced professional book that shows how to use Visual Studio 2008, C# 2008, and the .NET 3.5 classes to develop Windows Forms applications. It's an object-oriented book that shows how to use business classes, inheritance, and interfaces the way they're used in the real world. It's a database programming book

that shows how to prototype professional database applications using RAD features like data sources and the DataGridView control. And it's a book that shows you how to take advantage of 2008 features like object and collection initialisers, automatically implemented properties, and LINQ. When you're done, you'll be able to develop three-tiered, object-oriented applications the way the best professionals develop them. That's why we say: No other book teaches you so much, so fast, or so thoroughly.
