Our most familiar possession should not be a mystery to us. The human body is a wonderful thing, as readers of

this book will soon learn. Ilse Goldsmith presents anatomy and physiology like a series of unfolding discoveries as she gracefully explores the structure and functions of bones, muscles and organs.

Using comparisons with familiar objects that every child can understand, she answers questions such as: Why is some hair curly and some straight? How does a broken bone heal? What causes a cavity in a tooth? How do eyes wink?

The book includes many easy experiments and tests which the child can perform, illustrating the ways that eyes, ears and muscles work. It even tells how to make a workable stethoscope, and actually listen to heartbeats.
