This comprehensive overview of immune reactions inducing fertility disorders in both sexes first describes the nature and the function of sperm antigens which are capable to induce immune infertility as well as the methods to analyse and characterize these antigens. Secondly, the nature, the origin and induction of antisperm antibodies (ASA) in both sexes and the role of reproductive organs and their interaction with the immune system will be discussed. A large section of the book, which is most important for clinicians working in reproductive medicine, deals with the clinical impact of the immune reaction in reproductive medicine, including the methods of determination and the treatment in immune infertility. Closely related to immune infertility is the development of immune contraceptives which is also discussed.
