Showing that economic development and public health, often thought of as distinct, are both interdependent and dependent on social and political conditions, this book provides a new appreciation of the close relationship between microenterprise development and health in developing countries. Many of the world's poor earn a living from microenterprises, often outside the formal economy, and international practitioners have recently turned their attention to this underground economy, providing support through group poverty lending and village banking models, but overlooking the potential benefits of linking income generation with public health. This book argues for a conceptual and practical relationship between microenterprise development and household health, nutrition, and sanitation. To support their framework, the authors look at specific actions for harnessing the power of microeconomic development to improve health and human development. They support their argument further with case studies of innovative programs carried out in Latin America, Asia, and Africa. The book challenges the reader to cross disciplinary and professional boundaries to not only understand the interrelationships between health and income generation but to use available tools to enhance those interrelationships.
