The age of Baroque witnessed the construction of some magnificent buildings, but

what did the work of architects such as Bernini, Guarini and Wren have to do with Descartes, Galileo and Newton? In this book, George L. Hersey explores the ways in which Baroque architecture, with its shapes and experimentation with classical forms, reflects the scientific thinking of the time. He introduces us to a concept of geometry that encompassed more than the modern science of today, one that included geometrics (number and shape games), as well as introducing us to the art of geomancy, or magic and phrophecy using shapes and numbers. At first the text concentrates on specific problems in geometry and architectural design, and then it explores the affinities between music and several types of architectural form. Hersey shows how architects incorporated light into their architecture and how abstract ideas were transformed into visual, tactile form. He also looks at how Baroque form resonates in the modern form, in the work of architects such as Frank Lloyd Wright and Le Corbusier. A disccusion of modern links to the past rounds off this re-examination of Baroque beliefs and practices.
