What is consciousness? Recent attempts to answer this question have motivated two interdisciplinary conferences sponsored by the University of Arizona in Tucson. The first volume of *Toward a Science of Consciousness* is now considered a resource book for the emerging field. This volume presents a selection of invited papers from the

second conference, held in April 1996. The book's fifteen sections demonstrate the broad range of fields now focusing on consciousness. The sections include philosophy, cognitive science, medicine, neurobiology, neural correlates, vision, sleep and dreaming, anesthesia, molecular biology and evolution, quantum theory, spacetime, hierarchical organization, and experiential approaches. Each section is preceded by an overview and commentary. The participants include Bernard Baars, Ned Block, David J. Chalmers, Patricia S. Churchland, Daniel C. Dennett, Jeffrey Gray, Daniel Hillis, J. Allan Hobson, Stephen LaBerge, Jaron Lanier, Daniel S. Levine, Nikos K. Logothetis, Gary E. Schwartz, John R. Searle, Roger N. Shepard, Henry P. Stapp, Petra Stoerig, Charles T. Tart, John Taylor, Francisco J. Varela, Max Velmans, Roger Walsh, and Lawrence Weiskant.
