More than two decades into the global HIV epidemic, many HIV positive patients who have access to antiretroviral medications are graying. These patients and their clinicians now face another set of complex health issues related to aging. HIV and Aging examines the known effects of HIV and HIV medications on older patients and on their immune systems. The book explores the coalescence of aging and HIV on neurologic, psychiatric, cardiovascular, endocrine, renal, and pulmonary systems and oncology. Written by some of today's top experts, HIV and Aging answers questions like: ULUL/ULLIWhat are the similarities with immune system changes that occur with aging and those associated with HIV?/LILIWhat effects do HIV and HIV medications have on cardiovascular health?/LILIWhat do we know about drug interactions between antiretrovirals and medicines used to treat diseases of aging?/LI/UL

大致翻了一下，还是蛮有启发的：将艾滋和衰老结合起来讨论，算是颠覆了遗忘的认识。本书具体分析艾滋的患病及治疗如何影响免疫系统、神经系统、心血管疾病、激素代谢、肺功能及癌症，从而对衰老加速造成一定影响。鄙人实在没有能力继续读下去——第一章的CD8+ Memory T-cell Responses就已经把我吓傻了。
