Animal Habitats presents a huge range of animals, from tiny beetles to elephants, and explains the special problems of living where they do, and the solutions they have evolved. It visits a wide range of climates and habitats, from tropical grasslands and vast tracts of forest, to rivers and deep oceans. Maps show the worldwide distribution

of different animals, and reveal that some have succeeded in pushing the boundaries of their range to incredible limits. With amazing wildlife photography and lively, information-packed text, this book brings the world of wild animals vividly to life.
