From eco-niche to mega-trend: The new book series, "green designed," presents the most attractive and exciting examples of eco-design the creative world has to offer. Many brilliant pictures and a succinct and informative narrative show that a life-style aimed at conserving our natural resources with eco-friendly products can be fun and even glamorous. The first volume introduces a unique selection of more than 40 unusual and forward-looking car designs that will change the world: Hybrid cars that are already in mass production; automobiles soon to be produced, powered with natural gas, bio fuel or electricity; and concepts of fuel-cell vehicles. Take a glimpse into the future with fascinating details about one-seaters, egg-shaped "tricycles" and

lightweight clean-air sports cars, as well as green city cars and luxury limousines.
