出版者:Helvetica Chimica Acta Verlag,Switzerland

出版时间:2009-6

装帧:

isbn:9783906390529

This book provides an excellent overview on the status of contemporary studies of

peptaibiotics, covering aspects ranging from the search for novel bioactive compounds and their biosynthetic aspects to the total chemical synthesis and exploitation of X-ray diffraction and various spectroscopic techniques, to considerations of their membrane-modifying properties, including mechanisms of transmembrane channel formation through peptide self-association. The articles compiled in this book represent also a legitimization of the long-standing interest of the Editors and their co-workers and collaborators in the field of natural and synthetic Aib-rich peptides, and are an appropriate tribute to the pioneers of the research in peptaibiotics.
