"Advances in Subsurface Contamination of Porous Media: Indicators, Processes and

Modelling" will fill the gap of the necessity to develop a high level of knowledge of the processes concerning common and emergent contaminants through their passage from soil to groundwater. The book presents new methodologies and indicators to reach a better understanding of biogeochemical processes as a basis for environmental models. The combined use of the understanding of processes and models' prognosis will inform researches and water managers and will provide the possibility for better management and preservation of water resources. The book will be a valuable reference for graduate students, researchers and professionals in government and public institutions, and for those interested in soil and groundwater contamination in various aspects.
