isbn:9783527320950

This first book to focus on the topic serves as a basis for defining a roadmap for the role of catalysis in energy production. As such, this ready reference for researchers and engineers covers all the hot topics from a broad perspective -- fuel cells, hydrogen production and storage, methane storage and industrial catalysis.

With its analysis of new directions and opportunities in the area and its integration of industrial, governmental and academic points of view, this is a real must-have for everyone interested in "greener" energy production.
