Real convergence has gained substantial momentum in central, eastern and south-eastern Europe. Countries in these regions are all involved in the European integration process, either as recently joined EU member states, candidate countries, or potential candidates for membership. It has therefore become increasingly important to consider methods of catching up, to explore cross-country differences and to review key policy challenges for the convergence process. Through considering these issues in detail, prospects for future adoption of the euro can also be assessed. This book brings together policymakers, high-level practitioners, academics, and experts from central banks and international institutions in order to explore the key policy challenges facing the convergence process. Contributions focus especially on inflation, growth, migration and the balance of payments. This book is an essential read for all scholars interested in the transition of central, eastern and south-eastern Europe, and in the process of EU integration and enlargement.
