The vast majority of scientists agree that global warming is real and caused by our own actions. Growing concentrations of heat-trapping greenhouse gases in our atmosphere have already caused changes. Glaciers are melting, plants and animals are forced from their habitats, 'tropical' diseases like malaria are spreading to higher altitudes, and the number of severe storms and droughts is increasing. Comprehensive in scope and accessible to all reader levels, "The Encyclopedia of Global Warming Science and Technology" covers a vast range of topics, concepts, issues, processes, and scientists sifted and melded from the many scientific and technological fields. These include atmospheric chemistry, paleoclimatology, biogeography, oceanography, geophysics, glaciology, soil science, and more. Bruce E. Johansen digests the explosion of scientific work on global warming that has been published since 1980 and presents it in a set that is sure to be the indispensable standard reference work on the topic. The information here is of importance to just about everyone on the planet - for the findings of global warming science and technology should dictate the choices we make today to secure our common future. This encyclopedia will prove useful for many different types of professionals, inasmuch as global warming science informs public policy debates, applied science, and technology in such fields as energy generation, architecture, engineering, and agriculture.
