The understanding of chemokines, the proteins that control the migration of cells, and their receptors, is critical to the study of causes and therapies for a wide range of human diseases and infections, including certain types of cancer, inflammatory diseases, HIV, and malaria. This volume, focusing on chemokines as potential targets for disease intervention, and its companion volume ("Methods in Enzymology", volume 462, focusing on chemokine structure and function, as well as signaling) provide a comprehensive overview and time-tested protocols in this field, making it an essential reference for researchers in the area. It gathers tried and tested methods and techniques from top players in the field. It provides an essential reference for the experienced research scientist.
