This volume reports on a large body of work led by the World Health Organization that is intended to strengthen the foundations for evidence-based policies aimed at health systems development. This has included work to develop a common conceptual framework for health systems performance assessment, to encourage the

development of tools to measure its components, and to collaborate with countries in applying these tools to measure and then to improve health systems performance. It began with the enunciation of a framework that specified a parsimonious set of key goals to which health systems contribute, and the first set of figures on goal attainment and health system efficiency in countries that were Members of the Organization was published in "The World Health Report 2000." This book provides a uniquely comprehensive exploration of many different facets of health systems performance assessment. It will be relevant for researchers, students and decision-makers seeking a more detailed understanding of concepts, methods and the latest empirical findings. While most authors in this volume take a global perspective, the findings have important implications for the development of national performance frameworks and the creation of a culture of accountability.
